TEAMGREEN · AI FOR REDUCING FOOD WASTE

Bake what you'll sell

Three questions every store asks us

1 · Why pay for it?

2 · Why keep paying?

3 · Can we trust it?

AI for Good Hackathon Norway 2026 · BI Norwegian Business School, Oslo · 19 October 2026

QUESTION 1 · WHY PAY FOR IT?

78% less food in the bin

Bakery today

1,764

units thrown away in 4 weeks

21,601 kr of production cost in the bin

With teamGreen

387

units thrown away in 4 weeks

4,748 kr of production cost in the bin

Also saved: **234 kg of food** and **586 kg CO_2e** (estimates)

Out-of-sample backtest, 22 Sep–19 Oct 2026 · synthetic bakery, 5 products · vs. last week + 20%

QUESTION 1 · WHY PAY FOR IT?

+12,201 kr profit in 4 weeks

Over 28 days, one bakery	Kroner
Saved on waste (production cost)	+16,853
Lost sales from selling out more	−4,652
Net profit change	**+12,201**
App subscription, per month	[990]

Sell-outs rise from 561 to 790 units. That lost margin is already subtracted.

≈ 12×

profit gain vs. app price

Revenue minus production cost: 137,482 kr vs. 125,281 kr

Same backtest · model + weather, Balanced goal · all kroner figures are estimates · [990 kr] is a placeholder

QUESTION 1 · WHY PAY FOR IT?

Bake less, without the risk

Most of the saving comes from dropping the “just in case” extra. The app makes that safe.

1

Bake less

A weather-aware forecast per product, tuned to the goal the owner picks, so they can drop the 20% extra.

Tomorrow’s plan

2

Sell it in time

If too much was baked, discounts of 15%, 30% or 50% are suggested as use-by nears.

Inventory

3

Recover the rest

Leftovers go into bags for surplus apps or food banks, getting back about ⅓ of their value.

Giveaway bags · End of day

QUESTION 2 · WHY KEEP PAYING?

Month one cuts your waste by three quarters. After that, we stop it creeping back.

Demand changes, staff change, seasons change. The app adjusts every week, so you don’t have to.

QUESTION 2 · WHY KEEP PAYING?

Six reasons stores stay

Reason	What it means for the store	Status
Daily work, done in seconds	Use-by checks, discount timing and bag packing	Today
Know-how outlasts staff	The routine lives in the app, not one person’s head	Today
Waste can’t creep back	A scorecard of kroner and kg saved keeps habits honest	Partly
Demand keeps changing	Weather-aware model; next: holidays, new products	Partly
Proof for reporting	Food-waste records for reporting and marketing	Roadmap
Better with every store	Benchmarks and forecasts from similar bakeries	Roadmap

Today = in our demo now · Partly = basic version exists · Roadmap = next steps for a real product

QUESTION 2 · WHY KEEP PAYING?

Pricing that grows with the value

Share of savings

We charge a share, e.g. [20%], of the savings we measure. Stop saving, stop paying.

Two tiers

A full tier while we cut your waste, then a lighter tier for the daily routine and reporting.

If the value drops for a store, the price drops too.

QUESTION 3 · CAN WE TRUST IT?

Your data stays yours

In our demo today

- Runs in the browser: no server, no database
- No API keys, no external AI service
- No personal data: product sales counts only

Planned for a real product

- Sales data only, never customer or card details
- Encrypted, hosted in the EU/EEA, each store kept separate
- Export or delete your data at any time
- Shared across stores only anonymised, with consent

QUESTION 3 · CAN WE TRUST IT?

AI suggests. The owner decides.

Guardrail	How it works in the app today
Human approval	Nothing is baked, discounted or donated automatically
Approval resets	Any edit clears approval, so nothing stale slips through
Fixed food-safety rules	Expired items are compost only: never sold, bagged or donated
Explained numbers	Every forecast shows its data: “last 4 Fridays: 29, 42, 38, 37”
Honest results	Shows sell-outs and a Limitations page, not just savings

Food-safety rules are fixed and checkable. They are never left to a model.

QUESTION 3 · CAN WE TRUST IT?

Known gaps, and how we close them

Bags vs. pickup time

Bags can hold items that expire before pickup.

Fix: only bag items still safe at pickup.

Selling hours

The countdown includes closed hours, so some discounts are too small.

Fix: count opening hours only.

Manual expiry check

End of day relies on staff ticking a “use-by passed” box.

Fix: fill it in from the inventory.

Next guardrails: cap changes at ±25% unless the owner confirms, flag low-confidence days, keep an audit log.

Try it on your own numbers

A 4-week pilot with your real sales data shows your own kroner saved.

WHY PAY

+12,201 kr profit in 4 weeks

WHY STAY

Stops waste creeping back

WHY TRUST

The owner decides; data stays yours
